**FOREST BIOMASS RETREIVAL**

Forest above-ground woody biomass is a fundamental biophysical variable describing the amount of woody matter within a forest. Assessment of forest above-ground woody biomass (AGB) is essential for national and regional forest carbon stocks and carbon stock changes estimation and reporting. The authors present the first forest biomass map over Poland, which was obtained in the framework of the ESA GlobBiomass project. The main purpose of the ESA GlobBiomass project is to better characterize and to reduce uncertainties of AGB estimates by developing an innovative synergistic mapping approach in five regional sites (Sweden, Poland, Borneo, Mexico, South Africa) for the epochs 2005, 2010 and 2015 and one global map for the year 2010. More on: [www.globbiomass.org](http://www.globbiomass.org)

**REFERENCE DATA**

National Inventory of Forest Condition

- location of plots corresponds to ICP Forests Network
- Systematic 16x16 km grid – inside 25 L-shaped group of sampling plots consisting of 5 plots located 200 m apart
- Circular plot size ~0.05 ha (~11.28 m radius)
- Conversion GSV to AGB

In Poland, forest covers almost 92,000 km² (29.4 % of the country)

**REMOTE SENSED DATA**

- ALOS PALSAR mosaic for 2009 & 2010
  - 25 m spatial resolution
  - HH, HV polarisation
- Landsat 5/7 Surface Reflectance mosaic
  (Hansen et al., 2013), Reference years 2010-2013,
  - 30 m spatial resolution, Bands 3,4,5 and 7
- Forest type map – Copernicus High Resolution Layers
  - Reference year 2012
  - 20 m spatial resolution

**METHODOLOGY**

Random Forest Regression

Separate Model for coniferous and broadleaf forest

Training (70% plots) & Accuracy assessment (30% plots)

**ACCUROCITY ASSESSMENT**

Independent validation at forest stand level

Validation performed at 1146 stands: 743 coniferous, 236 broadleaf and 187 mixed forest, data collected in 2012

1. Puszcza Notecza burn scar from 1992
2. Beskid Niski mountains
3. Białowieska NP

---

**ACKNOWLEDGEMENTS**

The research has been conducted within the Polish-Norwegian Research Programme, Narwey Grants, financed by the National Centre for Research and Development, as a part of the WICLAP project “Ecosystem stress from the combined effects of winter climate change and air pollution – how do the impacts differ between biomes?”. Special thanks to the GlobBiomass consortium for recommendation and scientific advice. The random forest regression was run using the EnMAP-Box 2.2.
